

ABSTRACT OF THE DISCLOSURE

A network management system and method comprising a network device and a managing apparatus that manages the network device. The managing apparatus has an event issuing control condition decision unit that determines the event issuing control condition of the network device according to the event processing capability of the managing apparatus, and a notifying unit that notifies the event issuing control condition to the network device. The network device performs the event issuing control according to the event issuing control condition notified from the managing apparatus.
